Strategic Recommendations

To improve performance, the company should focus on reducing delays in high **Traffic_Index** regions and optimizing long-distance routes (**Distance_km**) to lower costs and improve efficiency.

Inventory management must be strengthened by increasing stock levels in stores with low **Store_Coverage** to avoid stockouts.

High-risk deliveries (**Delay_Risk_Level**) should be prioritized to improve reliability.
AI models should be used more actively for demand forecasting and logistics planning to support better decision-making.

Finally, optimizing transportation and shipping modes will help reduce carbon emissions and support sustainability goals.
